

SIENVI AGENCY

Website Handoff Map

A clear, client-friendly guide to the website structure, features, workflows, editing tasks, integrations, and ownership.

Purpose of this document

Make the website understandable after handoff. The client should know what exists, how it works, what they can safely change, where information goes, and who is responsible for each part.

Prepared for:

CLIENT / PROJECT NAME

Website URL: _____

Handoff date: _____

HOW TO USE THIS MAP

This is not a technical manual. It is a plain-language operating map that helps the client understand the website as a working business system.

Clarity standard

A person with very little technical experience should be able to follow this document without guessing, decoding jargon, or contacting the developer for every small task.

The six sections

01 Website Snapshot The one-page summary: purpose, audience, goal, features, responsibilities, and critical links.	02 Visual Sitemap A map of every page and how the pages are grouped and connected.
03 Feature Map A practical inventory of what the website does and who can manage each feature.	04 User Journey Flow The path visitors take from arrival to the main business outcome.
05 Admin Editing Guide Simple instructions for common updates without breaking the website.	06 Integration / Data Flow A map showing where form, booking, sales, email, analytics, and customer data go.

Recommended delivery format

- [] PDF copy for easy reference and client handoff.
- [] Editable working copy stored in the project folder.
- [] Screenshots for every task that could confuse a non-technical user.
- [] Direct links to the correct admin tools and SOPs.
- [] Passwords shared through a secure password manager, never written in this document.

01 WEBSITE SNAPSHOT

This is the one-page summary. It should explain the website in plain English before the client reads anything else.

The test

The client should understand what the site is for, who it serves, what action visitors should take, what the site includes, and who owns each responsibility in under two minutes.

Area	What to show
Website purpose	What the site is meant to do. Example: generate qualified leads for a local service business.
Primary audience	Who the website serves. Be specific enough that the client recognizes the visitor.
Main conversion goal	The single main action: book a call, buy a product, submit a form, join, donate, or learn.
Key features	Forms, booking, checkout, blog, membership, portfolio, customer portal, search, or other core tools.
Owner responsibilities	What the client manages, what Sienvi Agency manages, and what a third-party vendor manages.
Important links	Admin login, analytics, hosting, backups, domain, SOPs, forms, CRM, and other operating links.

Snapshot template

Project / website	_____
Purpose	_____
Primary audience	_____
Main conversion	_____
Client manages	_____
Sienvi Agency manages	_____

02 VISUAL SITEMAP

This answers: What pages exist, how are they grouped, and how does someone move between them?

Why clients value this

A sitemap gives the client a map of the house. It prevents forgotten pages, hidden content, and confusion about where information belongs.

Example sitemap

- Home
 - About
 - Services
 - Web Design
 - SEO
 - Branding
 - Portfolio
 - Project Detail Pages
 - Blog
 - Blog Post Pages
 - Contact
 - Privacy Policy / Terms

What the tech team should capture

- [] Every live page, including pages that are not shown in the main navigation.
- [] Template-driven pages such as products, services, projects, courses, or blog posts.
- [] Redirects, archived pages, and pages that should not be indexed by search engines.
- [] Parent pages and child pages.
- [] Utility pages such as login, account, cart, checkout, confirmation, privacy, and terms.
- [] The primary navigation, footer navigation, and any member-only navigation.

Visual version

After the page list is confirmed, turn it into a simple chart in Figma, FigJam, Miro, Whimsical, Lucidchart, or Canva. Do not make the diagram more complex than the website.

03 FEATURE MAP

This answers: What does the website actually do, where does each feature appear, and who can manage it?

Why this is the most important section

Clients often think a website is only a set of pages. Operationally, it is a collection of features, visitor flows, integrations, and responsibilities. The feature map makes those moving parts visible.

Feature	What it does	Where it appears	Client can edit?	Notes
Contact Form	Captures inquiries	Contact page and footer	Yes	Sends to the client email and CRM.
Booking Calendar	Lets visitors book calls	Services page	Limited	Connected to Calendly. Availability is edited in Calendly.
Blog	Publishes articles	Blog section	Yes	Use the SEO checklist before publishing.
Testimonials	Displays customer reviews	Home and Services	Yes	Add through the CMS collection.
Analytics	Tracks visitors and actions	Entire website	No	Google Analytics is installed and access is linked below.

Feature inventory checklist

- | | |
|---|--|
| ☐ Lead capture forms | ☐ Booking or scheduling |
| ☐ Checkout and payments | ☐ Product catalog |
| ☐ Blog or resource library | ☐ Search |
| ☐ Member login | ☐ Course or LMS |
| ☐ Downloads | ☐ Testimonials |
| ☐ Live chat or chatbot | ☐ Email signup |
| ☐ CRM connection | ☐ Analytics and pixels |
| ☐ Cookie consent | ☐ Automations |

Ownership rule

Never write only "Yes" or "No" when editing is limited. State exactly what the client can change, where they change it, and what requires technical support.

04 USER JOURNEY FLOW

This answers: How does a visitor move through the website and reach the main business outcome?

Example: service-business lead journey

04 USER JOURNEY FLOW: BUSINESS LOGIC

Document the website as a business machine, not only as a digital brochure.

What the journey should prove

The website should connect visitor demand to a measurable outcome. Each major step should reduce confusion, build trust, and move the visitor closer to action.

For each primary journey, document

Journey element	What to record
Entry point	Where the visitor arrives: homepage, landing page, product page, article, or referral page.
Visitor problem	The problem, desire, or question that brought the visitor to the website.
Decision content	The copy, proof, pricing, FAQ, product details, or examples that help the visitor decide.
Conversion action	The exact action the visitor should take.
System response	What happens after the action: confirmation, email, booking, order, CRM entry, or task.
Owner follow-up	Who is responsible for the next human or automated step.
Success measurement	How the result is tracked: form submissions, booked calls, purchases, signups, or revenue.
	Demand check Real demand is tied to problem intensity, urgency, how easily the audience can be reached, and whether people already take action or pay for a solution. The journey map should show how the website turns that demand into a business result.

05 ADMIN EDITING GUIDE

This answers: How can the client update the website without accidentally breaking it?

Simple SOP rule

Each instruction should name the exact menu, page, field, button, and final check. Add screenshots beside the steps whenever the interface is not obvious.

Task	Steps
Edit homepage text	Go to Pages > Home > Edit the correct section > Save > Preview the live page.
Add a blog post	Go to Blog > New Post > Add title, copy, image, category, and SEO description > Preview > Publish.
Update service pricing	Go to Services CMS > Select the service > Edit the pricing field > Save > Check the service page.
Add a testimonial	Go to Testimonials CMS > New Testimonial > Add name, quote, role, and image > Save.
Check form submissions	Open the forms dashboard or connected email / CRM > Confirm the newest submission and status.

Every SOP should include

- [] The purpose of the task.
- [] The exact admin area or tool to open.
- [] Numbered steps in the correct order.
- [] Screenshots with the correct buttons or fields highlighted.
- [] What should not be changed.
- [] How to preview before publishing.
- [] How to confirm the update worked.
- [] Who to contact when the result looks wrong.

Safe editing rules

Before making a change

Create a backup when the task affects layout, code, plugins, integrations, navigation, payments, forms, or user access. Small content edits should still be previewed before publishing.

- [] Do not delete pages, sections, products, CMS fields, or integrations unless the impact is confirmed.
- [] Do not paste heavily formatted text directly from another document. Use plain text when possible.
- [] Do not change domain, DNS, payment, email, or analytics settings without technical review.
- [] Record major changes in the project change log.

06 INTEGRATION / DATA FLOW MAP

This answers: Where does information go after a visitor submits a form, books, buys, signs up, or logs in?

Example: lead capture flow

Example: ecommerce purchase flow

06 INTEGRATION INVENTORY

Record the systems, owners, access links, data handled, and failure checks for every important connection.

System / integration	Purpose	Data handled	Owner	Failure check
Form tool	Collect inquiries	Name, email, phone, message	Client / Sienvi	Submit a test form and confirm receipt.
CRM	Manage leads and follow-up	Contact details, status, notes	Client	Confirm the new lead and automation.
Booking tool	Schedule calls	Contact details, selected time	Client	Book a test appointment.
Payment processor	Process payments	Order and payment records	Client	Use test mode or verify a completed order.
Analytics	Track behavior and conversions	Anonymous visitor and event data	Sienvi / Client	Confirm live events and conversion tracking.
Email platform	Send campaigns and automations	Subscriber data and activity	Client	Confirm new subscribers enter the right list.

Priority systems

This map is essential for lead generation, ecommerce, booking, CRM, analytics, email marketing, memberships, course platforms, customer portals, and automation.

WEBSITE HANDOFF COMPLETION CHECKLIST

Use this before the project is marked complete or the client becomes responsible for ongoing website management.

Website overview

- ☐ Website purpose, audience, and main conversion are written in plain language.
- ☐ Client and Sienvi Agency responsibilities are clearly separated.
- ☐ All important links are included and tested.

Structure and features

- ☐ Every live page is included in the sitemap.
- ☐ Every important feature is included in the feature map.
- ☐ Editing permissions and limitations are documented.

Journeys and data

- ☐ The primary visitor journey is mapped from entry to business outcome.
- ☐ Every form, booking, purchase, signup, and login flow is tested.
- ☐ Integrations and data destinations are documented.

Client operations

- ☐ Common editing SOPs are complete.
- ☐ Screenshots are current and match the live admin interface.
- ☐ The client knows how to preview, publish, check, and reverse changes.

Access and security

- ☐ Admin roles use the minimum access required.
- ☐ Passwords are stored in a secure password manager.
- ☐ Backups, domain, hosting, analytics, and recovery ownership are confirmed.

Final verification

- ☐ All links, forms, buttons, checkout steps, emails, and mobile layouts are tested.
- ☐ The client has received the PDF and editable working copy.
- ☐ The handoff call is complete and remaining support terms are confirmed.

Final standard

A handoff is complete only when the client can understand the website, operate the common tasks, recognize the limits of their access, and know exactly where to go when something fails.
