

# Website Handoff Map

A clear, client-friendly guide to the website structure, features, workflows, editing tasks, integrations, and ownership.

## Purpose of this document

Make the website understandable after handoff. The client should know what exists, how it works, what they can safely change, where information goes, and who is responsible for each part.

### PREPARED FOR:

**CLIENT / PROJECT:** The Billionaire Brother (Agentic Executive Platform)

**Website URL:** <https://mybillionairebrother.com>

**Handoff date:** August 5, 2026

## HOW TO USE THIS MAP

This is not a technical manual. It is a plain-language operating map that helps the client understand the website as a working business system.

### Clarity standard

A person with very little technical experience should be able to follow this document without guessing, decoding jargon, or contacting the developer for every small task.

### The six sections

#### 01 Website Snapshot

The one-page summary: purpose, audience, goal, features, responsibilities, and critical links.

#### 02 Visual Sitemap

A map of every page and how the pages are grouped and connected.

#### 03 Feature Map

A practical inventory of what the website does and who can manage each feature.

#### 04 User Journey Flow

The path visitors take from arrival to the main business outcome.

#### 05 Admin Editing Guide

Simple instructions for common updates without breaking the website.

#### 06 Integration / Data Flow

A map showing where form, booking, sales, email, analytics, and customer data go.

### Recommended delivery format

- ☒ **PDF copy** for easy reference and client handoff.
- ☒ **Editable working copy** stored in the project folder.
- ☒ **Screenshots & Diagrams** for every task that could confuse a non-technical user.
- ☒ **Direct links** to the correct admin tools, dashboards, and SOPs.
- ☒ **Passwords shared** through a secure password manager, never written in this document.

01

WEBSITE SNAPSHOT

This is the one-page summary. It should explain the website in plain English before the client reads anything else.

The test

The client should understand what the site is for, who it serves, what action visitors should take, what the site includes, and who owns each responsibility in under two minutes.

| Area                   | What to show                                                                                                                                 |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Website purpose        | High-performance AI business mentorship & execution platform ("Derek - Your Billionaire Brother") that turns goals into daily execution.     |
| Primary audience       | Founders, startup creators, solo entrepreneurs, and executives looking for elite business guidance and accountability.                       |
| Main conversion goal   | Complete onboarding interview, generate AI business strategy blueprint, and subscribe to Pro / Billionaire Tier.                             |
| Key features           | AI Board Meeting Simulator, Daily Office Chat, Onboarding Calibration, Ship-Pack Exporter, Weekly Action Step Tracker, Admin Cost Analytics. |
| Owner responsibilities | Client manages business goals & email marketing; Sienvi Agency manages Next.js codebase, Supabase DB, Stripe, and Gemini AI integration.     |
| Important links        | App URL (mybillionairebrother.com), Admin Portal (/admin), Vercel Hosting, Supabase Console, Stripe Dashboard, Resend Console.               |

Snapshot summary template

|                       |                                                                                                                |
|-----------------------|----------------------------------------------------------------------------------------------------------------|
| Project / website     | The Billionaire Brother ( <a href="https://mybillionairebrother.com">https://mybillionairebrother.com</a> )    |
| Purpose               | Empower founders with AI executive strategy, C-suite advisory board simulation, and weekly execution tracking. |
| Primary audience      | Entrepreneurs, venture founders, and high-performance business builders.                                       |
| Main conversion       | Interactive onboarding completion & paid monthly/annual Pro subscription via Stripe.                           |
| Client manages        | Strategic goals, daily mentor chats, marketing campaigns, testimonial reviews, and business offer content.     |
| Sienvi Agency manages | Full-stack Next.js maintenance, Supabase database, Gemini AI API integration, payment webhooks, and security.  |

## 02 VISUAL SITEMAP

This answers: What pages exist, how are they grouped, and how does someone move between them?

### Why clients value this

A sitemap gives the client a map of the house. It prevents forgotten pages, hidden content, and confusion about where information belongs.

### Complete Site Map Tree

- **Home (<https://mybillionairebrother.com>)**
  - **Public Pages**
    - Onboarding Interview (/onboard)
    - Interactive Guide (/guide) & Framework (/framework)
    - Public Testimonials (/testimonials) & Contact (/contact)
  - **Auth & Security**
    - User Login & Signup (/auth/login, /auth/signup)
  - **Authenticated App Dashboard (/dashboard)**
    - Main Overview Dashboard (/dashboard)
    - AI Board Meeting Simulator (/board-meeting)
    - Daily Executive Office Chat (/office) & General Chat (/chat)
    - Business Strategy & Strategy Brief (/strategies, /brief)
    - Ship-Pack Exporter (/ship-pack) & Playbook (/playbook)
    - Execution Tasks & Commit Tracker (/tasks, /commit)
    - Social Proof Generator (/social) & Account Settings (/settings, /upgrade)
  - **Administrative Portal (/admin/admin)**
    - AI Token & Budget Analytics (/admin/costs)
    - Email Marketing & Campaign Sender (/admin/email-marketing)
    - Testimonials & Social Proof Management (/admin/social-proof)
  - **Legal & Utility Pages**
    - Terms (/terms), Privacy (/privacy), Refunds (/refunds), Data Usage (/data-usage), Delete Account (/delete-account)

### What the tech team captured

- |                                                                                                      |                                                                                                        |
|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| <input checked="" type="checkbox"/> Every live page, including unlinked dashboard & admin subroutes. | <input checked="" type="checkbox"/> Parent pages and child routes clearly nested.                      |
| <input checked="" type="checkbox"/> Dynamic template pages (Strategies, Playbooks, Ship Packs).      | <input checked="" type="checkbox"/> Utility pages (Auth login, billing checkout, terms, privacy).      |
| <input checked="" type="checkbox"/> API endpoints & webhooks mapped for background sync.             | <input checked="" type="checkbox"/> Primary navigation, sidebar navigation, and admin security bounds. |

03 FEATURE MAP

This answers: What does the website actually do, where does each feature appear, and who can manage it?

Why this is the most important section

Clients often think a website is only a set of pages. Operationally, it is a collection of features, visitor flows, integrations, and responsibilities. The feature map makes those moving parts visible.

| Feature                  | What it does                                                                   | Where it appears        | Client edit? | Notes                                                   |
|--------------------------|--------------------------------------------------------------------------------|-------------------------|--------------|---------------------------------------------------------|
| Derek AI Mentor          | Interactive AI strategist providing real-time advice & floating chat.          | Global widget & /office | Limited      | Persona calibrated via knowledge files & system prompt. |
| AI Board Meeting         | Simulates C-suite advisory board (CEO, CMO, CTO, CFO) for strategic decisions. | /board-meeting          | No           | Powered by Google Gemini 3.1 Pro API.                   |
| Onboarding Questionnaire | Captures user business goals, revenue targets, and operational challenges.     | /onboard                | Yes          | Form fields & step logic edited in Next.js component.   |
| Ship-Pack Generator      | Packages AI strategy into downloadable execution blueprints.                   | /ship-pack              | Yes          | Exports formatted PDF / Markdown for team execution.    |
| Stripe Billing           | Processes monthly/annual subscription upgrades for Pro tier.                   | /upgrade & /api/billing | Limited      | Price IDs & plans configured in Stripe Dashboard.       |
| AI Cost Analytics        | Monitors API token usage, cost per session, and cost guardrails.               | /admin/costs            | Yes          | Admin can set max spend limits & alert thresholds.      |
| Email Campaigns          | Sends automated weekly action steps & promotional newsletters.                 | /admin/email-marketing  | Yes          | Template editor connects to Resend Email API.           |

Feature inventory checklist

- ☒ AI Questionnaire & Calibration
- ☒ AI C-Suite Board Meeting Simulator
- ☒ Weekly Action Item Commit Tracker
- ☒ Supabase Auth & Session Security
- ☒ Resend Email Newsletter Engine
- ☒ Google Analytics 4 Telemetry
- ☒ Stripe Subscription & Checkout
- ☒ Ship-Pack Exporter & Playbooks
- ☒ Floating Derek AI Chat Assistant
- ☒ Admin AI Token Cost Analytics
- ☒ Social Proof & Testimonial Manager
- ☒ Chrome Extension API Endpoints

Ownership rule

Never write only "Yes" or "No" when editing is limited. State exactly what the client can change, where they change it, and what requires technical agency support.

## 04 USER JOURNEY FLOW

This answers: How does a visitor move through the website and reach the main business outcome?

### Primary Journey: Founder Strategy & Subscription Flow

## 04

## USER JOURNEY: BUSINESS LOGIC

Document the website as a business machine, not only as a digital brochure.

**What the journey should prove**

The website should connect visitor demand to a measurable outcome. Each major step should reduce confusion, build trust, and move the visitor closer to action.

**Journey Element Record**

| Journey element     | What to record                                                                                                   |
|---------------------|------------------------------------------------------------------------------------------------------------------|
| Entry point         | Homepage (`/`), Onboarding landing (`/onboard`), Framework overview (`/framework`), or Chrome extension.         |
| Visitor problem     | Lack of clarity on business growth priorities, lack of executive accountability, and inefficient execution.      |
| Decision content    | Interactive Derek preview, pricing plans comparison, client testimonials, and sample Board Meeting transcript.   |
| Conversion action   | Submitting the onboarding interview and purchasing a Pro membership via Stripe checkout.                         |
| System response     | Instant Supabase session auth, automated welcome email via Resend, and generation of strategy profile.           |
| Owner follow-up     | Automated weekly action email + client dashboard notifications + agency support escalation if flagged.           |
| Success measurement | Tracked via Google Analytics 4 (conversions), Stripe Dashboard (MRR), and Admin Cost Analytics (user retention). |

**Demand check**

Real demand is tied to problem intensity, urgency, how easily the audience can be reached, and whether people already take action or pay for a solution. The journey map shows how the website turns that demand into a business result.

## 05 ADMIN EDITING GUIDE

This answers: How can the client update the website without accidentally breaking it?

### Simple SOP rule

Each instruction should name the exact menu, page, field, button, and final check. Add screenshots beside the steps whenever the interface is not obvious.

| Task                           | Steps                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Edit homepage copy</b>      | Go to `src/app/page.tsx` or CMS → Edit hero headline / copy → Save file → Run `npm run build` or push git commit → Verify live site. |
| <b>Update Derek AI Persona</b> | Go to `knowledge files/` or Admin Portal → Edit calibration text file → Re-deploy → Test Derek response in `/office` chat.           |
| <b>Send Email Newsletter</b>   | Go to `/admin/email-marketing` → Click New Campaign → Enter Subject & Body → Select Audience → Click Send via Resend.                |
| <b>Monitor AI Costs</b>        | Go to `/admin/costs` → Review daily token spend graphs → Verify budget guardrail limits (\$50/day max) → Adjust if needed.           |
| <b>Manage Beta Testers</b>     | Go to `/admin/beta-testers` → View applicant queue → Click Approve/Reject → System sends automated invitation email.                 |
| <b>Manage Testimonials</b>     | Go to `/admin/social-proof` → Click Add Testimonial → Enter founder name, photo, quote, rating → Click Publish.                      |

### Every SOP should include

- ☒ The purpose of the task.
- ☒ The exact admin area or tool to open.
- ☒ Numbered steps in the correct order.
- ☒ Screenshots with correct buttons highlighted.
- ☒ What should not be changed.
- ☒ How to preview before publishing.
- ☒ How to confirm the update worked.
- ☒ Who to contact when the result looks wrong.

### Before making a change (Safe Editing Rules)

Create a backup or git branch when the task affects layout, code, database schemas, integrations, navigation, payments, or API keys. Small content edits should still be previewed on staging before publishing.

## 06

## INTEGRATION &amp; DATA FLOW MAP

This answers: Where does information go after a visitor submits a form, books, buys, signs up, or logs in?

**Flow 1: User Onboarding & AI Strategy Generation****Onboarding Form Submission**

Visitor completes business questionnaire on `/onboard`.

**Next.js API Route (/api/questionnaire)**

Validates payload, sanitize inputs via DOMPurify.

**Google Gemini AI SDK (@google/genai)**

Processes prompt with knowledge files calibration & generates executive strategy.

**Supabase Database Storage**

Stores user profile, strategy blueprint JSON, and initial action steps.

**Resend Email Welcome Notification**

Automated email dispatched with strategy summary and login magic link.

**Flow 2: Pro Tier Subscription & Stripe Billing****Checkout Click on /upgrade**

User selects Pro monthly (\$49/mo) or annual plan (\$490/yr).

**Stripe Hosted Checkout Page**

Securely handles credit card processing & PCI compliance.

**Stripe Webhook Handler (/api/webhooks/stripe)**

Receives `checkout.session.completed` & updates user subscription status in Supabase.

06 INTEGRATION INVENTORY

Record the systems, owners, access links, data handled, and failure checks for every important connection.

| System / integration | Purpose                                                           | Data handled                                                     | Owner           | Failure check                                                                                  |
|----------------------|-------------------------------------------------------------------|------------------------------------------------------------------|-----------------|------------------------------------------------------------------------------------------------|
| Supabase Auth & DB   | User authentication & relational data storage.                    | User credentials, session tokens, strategy records, commit logs. | Sienvi / Client | Test signup on <code>/auth/login`</code> & inspect Supabase console logs.                      |
| Stripe Gateway       | Payment authorization & recurring subscription billing.           | Credit card tokens, customer IDs, plan tiers, payment events.    | Client          | Perform test purchase using Stripe test card & verify webhook.                                 |
| Google Gemini API    | Powers Derek AI, C-Suite Board Meetings, and Ship Packs.          | User prompt text, persona calibration context, token usage.      | Sienvi Agency   | Check <code>/api/chat`</code> response & verify API key validity in <code>.env.local`</code> . |
| Resend Email API     | Transactional emails, welcome messages, and newsletter campaigns. | Recipient email, subscriber status, email templates.             | Client / Sienvi | Send test campaign via <code>/admin/email-marketing`</code> & check inbox.                     |
| Google Analytics 4   | Tracks website traffic, conversion events, and page views.        | Anonymous visitor behavior, page hits, UTM parameters.           | Client          | Open GA4 Realtime Dashboard & trigger test page view.                                          |
| Chrome Extension API | Enables quick chat & prompt insertion from browser bar.           | Auth session key, page context snippets.                         | Sienvi Agency   | Verify response on <code>/api/extension`</code> endpoint.                                      |

Priority systems

This map is essential for AI strategy generation, subscription payment processing, database security, email deliverability, token cost monitoring, and Chrome extension cross-platform sync.

## WEBSITE HANDOFF COMPLETION CHECKLIST

Use this before the project is marked complete or the client becomes responsible for ongoing website management.

### Website overview

- ☒ Website purpose, audience, and main conversion are written in plain language.
- ☒ Client and Sienvi Agency responsibilities are clearly separated.
- ☒ All important links (App, Admin, Supabase, Stripe, Resend, Vercel) are included and tested.

### Structure and features

- ☒ Every live page and subroute is included in the sitemap.
- ☒ Every important feature (AI Board Meeting, Derek Chat, Ship Packs, Stripe, Admin) is included in the feature map.
- ☒ Editing permissions and technical limitations are clearly documented.

### Journeys and data

- ☒ The primary visitor journey is mapped from entry to business outcome.
- ☒ Every form, onboarding interview, purchase, signup, and login flow is tested.
- ☒ Integrations and data destinations are fully documented in the inventory map.

### Client operations & security

- ☒ Common editing SOPs (copy, persona calibration, email campaigns, cost guardrails) are complete.
- ☒ Admin roles use minimum required access rights.
- ☒ Passwords & API keys stored in secure environment variables / 1Password.

### Final standard

A handoff is complete only when the client can understand the website, operate the common tasks, recognize the limits of their access, and know exactly where to go when something fails.
